

MASTER INDEX

The Macfolio Engineering Textbook

A rebuild path from first command to architecture confidence

A beginner-to-engineer rebuild guide grounded in the real repository

PATTERN > PRACTICE > REPETITION > REFINEMENT > HABIT

How To Use This Course

This course assumes you know a little HTML, CSS, JavaScript, and React but have not yet developed strong project-organization instincts. Work through the volumes in order. Keep Macfolio open beside the book, type the important examples, and answer each checkpoint before reading onward.

Coverage: 180 files discovered; 149 text files read; 31 binary assets inspected; 0 unread; repository coverage 100%. The course uses actual repository code and does not claim behavior that was reconstructed from guesswork.

Volume	Build outcome
1. Start Without Hesitation	Create and configure the project; adopt a repeatable engineering rhythm.
2. Architecture You Can Feel	Design feature boundaries, dependencies, and state ownership.
3. From index.html to a Living Interface	Trace startup and compose responsive shells.
4. Build a Desktop Inside the Browser	Implement the complete desktop window system.
5. Turn Remote Data into an Experience	Build GitHub data, Finder, and code-preview flows.
6. Make It Coherent, Then Make It Grow	Master CSS/mobile/browser APIs, deployment, and every repository file.

The Rebuild Order

1. Bootstrap Vite and understand the entry point.
2. Create app and feature boundaries before filling them.
3. Build desktop window state and one visible app.
4. Add Finder navigation and a local portfolio tree.
5. Connect public GitHub data through the portfolio mapper.
6. Add code preview and remaining desktop apps.
7. Build the separate mobile shell and mini-apps.
8. Organize CSS, failure states, accessibility, and performance.
9. Run production verification and deploy.
10. Review the repository atlas and explain ownership in your own words.

Confidence Contract

You do not need to know the whole final architecture before starting a new idea. You need a small set of questions, one coherent first slice, and the discipline to improve boundaries as real pressure appears. That is the central habit this textbook is designed to build.
